PROFESSIONAL SUMMARY

DevOps and Full Stack Engineer with 2 years of hands-on experience building platform tooling and developer portals. Proficient in Kubernetes (K3s), cloud platforms (OCI, AWS, Azure), CI/CD pipelines, and Node.js/Java microservices. Built a production-grade multi-cloud DevOps platform spanning 3 cloud providers with 5 microservices, 11 serverless functions, full observability stack (Prometheus, OpenTelemetry, Grafana Cloud), and push-to-deploy CI/CD under 3 minutes.

TECHNICAL SKILLS

Cloud & Infrastructure: AWS (EC2, S3, Lambda, SNS), Azure (Static Web Apps, Functions, Pipelines, Storage), OCI (VMs, Object Storage, Functions)

Kubernetes & DevOps: K3s, Helm, kubectl, Docker, Jenkins, Ansible, CI/CD

Infrastructure as Code: Terraform (OCI + AWS + Azure providers, remote state), Backstage Framework (plugin development)

Backend: Node.js, Express, REST API design, JWT (RS256), Redis, PostgreSQL

Frontend: React, Vite, Tailwind CSS, Chart.js, Azure Static Web Apps

Observability: Prometheus (PromQL), Grafana Cloud, OpenTelemetry (distributed tracing)

Languages: JavaScript / TypeScript, Java, Python, Bash / sh, HCL (Terraform), YAML

WORK EXPERIENCE

Associate DevOps Engineer | GoTo Technologies *Jul 2025 – Present • Bengaluru*

- Built a custom **Backstage Entity Provider** from scratch to automatically ingest 100+ internal services into the developer portal catalog, reducing manual service onboarding from ~2 hours to under 5 minutes per service.
- Shipped a **Feedback Plugin** to production, enabling engineers across 15+ teams to submit and track feedback directly inside the portal — driving measurable lift in platform adoption and unblocking cross-team communication.
- Owned reliability of the Backstage deployment as catalog usage grew across the engineering org, tuning ingestion patterns and resource limits to support sustained daily use.

Backstage Developer Intern | GoTo Technologies *Jan 2025 – Jun 2025 • Bengaluru*

- Diagnosed and resolved a critical **GitHub API rate-limit issue** blocking Backstage catalog ingestion, eliminating recurring portal outages during peak hours and restoring service discovery for 50+ repositories.
- Enhanced Backstage UI components and workflows across multiple portal pages, improving visual consistency and navigation patterns for the engineering org.
- Contributed to early design and prototyping of the **Feedback Plugin**, partnering with senior engineers on cross-team feedback architecture before shipping it to production as FTE.

PROJECTS

Multi-Cloud DevOps Platform — K3s · OCI · AWS · Azure · Node.js · Terraform · Grafana Cloud

Live: dashboard.lsuthar.in | Repos: [api-gateway](#) · [feature-flag-service](#) · [auth-service](#) · [dashboard](#)

- Built a production-grade internal DevOps platform spanning OCI, AWS, and Azure — provisioned entirely with Terraform using modular HCL across all three cloud providers with remote state in OCI Object Storage.
- Deployed a 2-node K3s cluster on always-free OCI AMD VMs (1 GB RAM each), tuning pod resource limits and swap files to run 5 microservices within a 2 GB RAM budget — demonstrating deep Kubernetes resource management.

- Built an **API Gateway** from scratch in Node.js: RS256 JWT verification, Redis sliding-window rate limiting, circuit breaker with AWS SNS alerting, flag-driven canary traffic splitting (consistent hashing per client ID), and dynamic route reloading every 30 seconds.
- Designed a **Feature Flag Platform** with Node.js/PostgreSQL backend, sub-5 ms Redis cache, percentage rollout support, full audit log, and real-time Slack notifications via Azure Functions Queue trigger.
- Built an async **audio extraction service** on AWS EC2 using FastAPI and ffmpeg — POST returns jobId in <500 ms, ffmpeg processes via Redis job queue, output stored in S3 with presigned download URLs; audio codec (MP3/AAC) controlled by feature flag from OCI.
- Deployed 11 serverless functions across AWS Lambda (S3 validator, file cleanup, circuit breaker handler, JWT key rotator), Azure Functions (GitHub webhook → Azure Pipelines trigger, flag change notifier, log pruner), and OCI Functions (JWT rotation with Instance Principal auth).
- Set up **Azure Pipelines CI/CD** with a self-hosted agent on the K3s node — achieving push-to-deploy in under 3 minutes with unlimited free build minutes; agent runs inside the OCI VCN for secure kubectl access over private network.
- Implemented the three pillars of observability: Prometheus metrics pushed to Grafana Cloud (PromQL dashboards + Slack alerting), custom K8s pod log collector with PostgreSQL full-text search and live-tail WebSocket, and OpenTelemetry distributed tracing to Grafana Cloud Tempo with auto-instrumented HTTP/Express/pg/Redis spans.
- Implemented **JWT Auth Service** with RS256 token issuance, refresh token rotation using httpOnly cookies, and Redis-backed token blacklist for immediate logout invalidation — API Gateway fetches the public key from Auth Service at startup.

Portfolio Website — *React · TypeScript · Tailwind CSS · Azure Static Web Apps · Cloudflare*

Live: portfolio.lisuthar.in | GitHub: github.com/lisuthar-coder/Portfolio

- Designed and deployed a personal portfolio site showcasing technical projects, work experience, and skills with responsive layouts optimized for mobile and desktop.
- Automated deployment via GitHub Actions to Azure Static Web Apps with custom domain and SSL through Cloudflare — push-to-deploy on every commit to main.

EDUCATION

B.E. Computer Science & Business Systems | JSSSTU, Mysuru *Graduated 2025*

CGPA: 9.0

PCMB (Class XII) | Shree Vinayak PU College 2021 • Bengaluru

100%

SSLC (Class X) | St. Philomena's High School 2019 • Bengaluru

95.36%
